1 New Release of the Operating System

- CPU OS release **06.05** for central modules of the H41q/H51q product family
- Previous release: 06.04

2 Changes with respect to Previous Release

In the new release of the operating system, one problem that could previously occur in certain - mostly rare - situations has been solved.

2.1 HF-AIX-3 Module

The described error has been corrected:

When using the HF-AIX-3 function block in Mode 3 (the "Mode" input has the value "3"), the following status could result temporary:

- the output "CHANNEL FAULT" was in the FALSE state and
- the default value "Value in the event of a fault" was present on the "VALUE" output.

Because "CHANNEL FAULT" was FALSE, the downstream logic could potentially consider the "Value in the event of a fault" correct and, depending on the application, trigger the associated reactions.

The malfunction occurred only in Mode 3.

3 Documentation

At all times, the most current documentation version for this operating system release available on the Internet at www.hima.com is applicable and valid.

The manual "Functions of the Operating System" of version BS41q/51q V7.0-8 (06.04) is also valid for edition BS41q/51q V7.0-8 (06.05).
